

moisture**MASTER**

Breathe it, love it

Remove moisture for a healthier home

**moistureMASTER™** is a controlled ventilation system that replaces the moist air in your home with drier, warm, fresh, filtered air. The result is a drier, warmer and healthier home - guaranteed.

**moistureMASTER™** is the most advanced ventilation system on the market, offering guaranteed results for controlling condensation and a 5 year warranty. A **moistureMASTER™** Home Ventilation system offers many benefits.

- 🔥 **Controls condensation, eliminates mould, mildew and odors**
- 🔥 **Enjoy a fresher, drier healthier home - Breathe easy with fresh filtered air**
- 🔥 **Save money on heating – a drier home is cheaper and easier to heat.**
- 🔥 **Heated systems – why introduce freezing air during winter?**
- 🔥 **A system to suit almost every home – even those with no roof cavity**
- 🔥 **Better security - you can now keep your doors and windows locked**
- 🔥 **Modular design means Heat Transfer, Summer Ventilation and Pure Air modules can be added.**

## WINTER

### *Drier Days and Nights*

**moistureMASTER™** prevents condensation and controls mould and mildew. No more water streaming down your windows. **moistureMASTER™** ventilation systems replace the moist contaminated air with drier, filtered fresh air. A drier home is easier and cheaper to heat because it requires less energy to heat. A dry home will feel warmer at the same or similar temperature to a damp home. A drier home is also healthier because moist air is the perfect breeding ground for mould and mildew.

### *Warmer Days and Nights*

**moistureMASTER™** recovers warm dry air from your roof cavity (if you have one), filters the air and gently introduces it into your home. This works well if there is heat in the roof cavity but, during the long cold winter nights, the air temperature in the roof cavity can be very cold. You still need this air to be introduced if you are to control condensation – the solution is the **moistureMASTER™** Thermaflow heater. The Thermaflow heater will take the chill off the air before it is introduced to your home. With a **moistureMASTER™** Heat transfer system you can even take the excess warmth in your home and transfer it to cooler rooms. The Heat Transfer system is controlled from the one electronic touch pad.

### *Healthier Air Day and Night*

The air in your home should be of the highest quality possible – free from excess moisture and pollutants. **moistureMASTER™** Ventilation systems with their superior filters and Pure Air modules combine to achieve the best air quality. The Pure Air module kills bacteria, viruses and mould spores and enriches the air with oxygen molecules. The Pure Air module is unique to **moistureMASTER™**.

## SUMMER

### *Cooler Nights*

**moistureMASTER™** Summer Kit gives you the advantage of ventilation and a cooler air supply. The Summer Kit sources cool air from the cooler shaded side of your home. This not only prevents heat build up during the day but your nights will be more comfortable – allowing you to get a better sleep.

### *Quieter Nights*

With a **moistureMASTER™** ventilation system you will be able to keep your windows closed and still enjoy the benefits of fresh cooler air being introduced. Your nights will be quieter.

## FORCED AIR VENTILATION

### moistureMASTER Forced Air Ventilation

Forced air ventilation (positive air pressure system) sources a fresh drier air supply from either the roof cavity or from outside the home, filters it and then gently introduces this air throughout the home. Obviously for every cubic metre of fresh dry air introduced a cubic metre of moist stale air is forced out. This stale air escapes through extraction points or through the gaps and tiny openings in your home.

This type of system suits almost every home and budget. **moistureMASTER™** forced air ventilation systems can be installed where there is no roof cavity – they can even be installed outside the home. It is simple, effective, efficient and guaranteed.

### moistureMASTER Summer Ventilation

**moistureMASTER™** Summer Ventilation Kit will take cooler air from outside and transfer it to the 'summer hot rooms' in your home.

### moistureMASTER Heat Transfer

**moistureMASTER™** Heat Transfer unit will take the excess heat from one room and transfer it to the cooler rooms in your home.

**moistureMASTER™** cost control programme (CCP) means you can set a monthly project for the heater operation. It even tells you exactly what the heater is costing you to operate.
